Project Design Phase
Problem – Solution Fit Template

Date	30 June 2026
Roll No	23A51A42A3
Project Name	Metro Ticket Generating System using ServiceNow
Maximum Marks	2 Marks

❑ 1. Customer Segments

❑ The primary customers are metro passengers, including students, office employees, and daily commuters who regularly use metro services. The secondary customers are metro administrators responsible for managing ticket bookings and maintaining booking records.

❑

❑ 2. Customer Constraints

❑ Passengers face long waiting times at ticket counters, especially during peak hours. Manual ticket booking consumes additional time and increases the possibility of errors. Administrators find it difficult to manage booking records efficiently without a centralized digital system.

❑

❑ 3. Available Solutions

❑ Existing solutions include manual ticket counters, ticket vending machines, and mobile ticket booking applications. However, these solutions may still involve waiting time, limited accessibility, or lack centralized workflow management. A ServiceNow-based solution provides an automated and organized ticket booking process.

❑

❑ 4. Jobs to Be Done / Problems

❑ Passengers need a simple system to book metro tickets quickly by selecting source and destination stations without waiting in queues. Administrators require an efficient system to manage ticket requests, booking records, and passenger information accurately.

❑

❑ 5. Problem Root Cause

- ❑ The primary cause of the problem is the dependence on manual ticket booking and record management. The absence of workflow automation, centralized data storage, and digital ticket generation leads to delays, increased workload, and inefficient management.
- ❑

❑ 6. Behaviors

- ❑ Passengers prefer digital services that are fast, reliable, and easy to use. They expect quick ticket confirmation and accurate fare calculation. Administrators prefer systems that automate repetitive tasks, maintain booking records, and generate reports efficiently.
- ❑

❑ 7. Triggers

- ❑ Long queues during peak hours, increased passenger traffic, growing demand for digital services, and the need for efficient ticket management motivate the adoption of an automated metro ticket booking system.
- ❑

❑ 8. Your Solution

- ❑ The proposed Metro Ticket Generating System is developed on the ServiceNow platform using the Service Catalog, custom tables, Flow Designer, Business Rules, and Notifications. The application enables passengers to book metro tickets online, automatically calculates fares, stores booking details, generates ticket records, and provides administrators with centralized booking management and reporting.
- ❑

❑ 9. Channels & Roadblocks

- ❑ The application is accessed through the ServiceNow Service Portal by authorized users. Possible challenges include internet dependency, user adoption, initial system configuration, and maintaining accurate station and fare information. These challenges can be addressed through proper system configuration, user training, and regular maintenance.

- ❑
